

**descriptive complexity theory wikipedia** - *descriptive complexity theory* descriptive complexity is a branch of computational complexity theory and of finite model theory that characterizes complexity classes by the type of logic needed to express the languages in them for example  $PH$  the union of all complexity classes in the polynomial hierarchy, **descriptive complexity umass cs** - *descriptive complexity* this means that the boolean queries computable in parallel time  $t$  are exactly those expressible by formulas consisting of a fixed quantifier block iterated  $t$  times and this is the same as the set of boolean queries expressible via first order inductive definitions that close in  $t$  steps, **descriptive complexity the full wiki** - *descriptive complexity* is a branch of finite model theory a subfield of computational complexity theory and mathematical logic which seeks to characterize complexity classes by the type of logic needed to express the languages in them for example  $PH$  the union of all complexity classes in the polynomial hierarchy is precisely the class of languages expressible by statements of second, **descriptive complexity a logicians approach to computation** - yes no problems are properties of the input the set of all inputs to which the answer is yes have the property in question rather than asking the complexity of checking if a certain input has a property  $t$  in descriptive complexity we ask how hard it is to express the property  $t$  in a formal language, **descriptive complexity canonisation and definable graph** - *descriptive complexity theory* establishes a connection between the computational complexity of algorithmic problems the computational resources required to solve the problems and their descriptive complexity the language resources required to describe the problems, **descriptive complexity survey and recent progress** - series in descriptive complexity we ask how rich a logical language is needed to describe a given computational problem it is natural that there might sometimes be a relation between descriptive complexity and traditional computational complexity remarkably there is an isomorphism in fact the most important complexity classes have very, **on descriptive complexity language complexity and gb** - on descriptive complexity language complexity and gb abstract we introduce  $L_{k,p}$  a monadic second order language for reasoning about trees which characterizes the strongly context free languages in the sense that a set of finite trees is definable in  $L_{k,p}$  if it is modulo a projection a local set the set of derivation trees generated by a cfg, **descriptive complexity cs stackexchange com** - time and space are two common parameters and also natural parameters to measure the complexity of the problem i am not able to understand the motivation behind defining descriptive complexity i search on the internet and find out that it is the complexity of expressing some property of the input take the example of the sorting problem, **descriptive complexity canonisation and definable graph** - *descriptive complexity canonisation and definable graph structure theory* by martin grohe is a digital pdf ebook for direct download to pc mac notebook tablet ipad iphone smartphone ereader but not for kindle a drm capable reader equipment is required similar products
