

**rho gtpases in cell biology nature** - rho gtpases are molecular switches that control a wide variety of signal transduction pathways in all eukaryotic cells they are known principally for their pivotal role in regulating the actin, **ras oncogenes and their downstream targets sciencedirect** - in the presence of magnesium ions the association of guanine nucleotides with small g proteins is generally very tight the dissociation constants of gdp and gtp are in the picomolar range  $k_d$  approximately 10 100 pm and therefore g proteins are usually present in a complex with either gtp or gdp although ras proteins have a measurable gtpase activity on their own gtp hydrolysis rate, **ras proteins and their regulators in human disease** - ras proteins are binary switches cycling between on and off states during signal transduction these switches are normally tightly controlled but in ras related diseases such as cancer rasopathies and many psychiatric disorders mutations in the ras genes or their regulators render ras proteins persistently active, **cell adhesion and signalling by cadherins and ig cams in** - ugo cavallaro obtained a ph d at the department of biological and technological research dibit in milan italy he worked as a postdoctoral fellow at dibit the institute of molecular pathology
